1) Find the Fourier transform of f(x), where f(x) = 1 for -2 < x < 2 and f(x) = 0 otherwise.

Question 1. Compute the Fourier transform of the following functions.

4) Find the Fourier transform of 
$$f(x) = \frac{1}{1+(x-3)^2}$$
.  
Solution. 1)  $\tilde{f}(\mu) = \frac{\sin 2\mu}{\pi \mu}$ . 2)  $\tilde{f}(\mu) = \frac{1}{\sqrt{2\pi}}e^{-\mu^2/2}$ . 3)  $\tilde{f}(\mu) = \frac{1}{\sqrt{2\pi}}e^{-2i\mu}e^{-\mu^2/2}$ . 4)  $\tilde{f}(\mu) = \frac{1}{2}e^{-3i\mu}e^{-|\mu|}$ .

Solution. 1) 
$$f(\mu) = \frac{1}{\pi \mu}$$
. 2)  $f(\mu) = \frac{1}{\sqrt{2\pi}}e^{-i\mu x} dx = \int_{-2}^{2} e^{-i\mu x} dx$ 

$$= \left[\frac{e^{-ipx}}{-i\mu}\right]_{-2}^{2} = e^{-2ip} - e^{2ip} = \frac{-2i\sin(2px)}{\mu} = \frac{2\sin(2px)}{\mu}$$
(2) This is Gaussian function confered at 0,  $\sigma = 1$ , multiplied by  $\sqrt{2}$ 

(2) This is Gaussian function confered at 0, 
$$\sigma = 1$$
, multiplied by  $5\pi$ 

$$\exists f(u) = \frac{5\pi}{2\pi} e^{-\frac{L^2}{2}} = \frac{1}{L^2} e^{-\frac{L^2}{2}}$$

(3) This function is a Gaussian centered at 2, 
$$\sigma=1$$
, multiplied by  $\Delta T$ .

So  $f(M) = \frac{\Delta T}{2T} e^{-2i\mu} - \frac{\mu^2}{2T} e^{-2i\mu} e^{-\frac{\mu^2}{2T}} e^{-2i\mu} e^{-\frac{\mu^2}{2T}}$ 

So 
$$f(W) = \frac{1}{2\pi} e^{-i\theta} e^{-i\theta} = \frac{1}{2\pi} e^{-2i\theta} e^{-2i\theta}$$

(4)  $f(W) = \frac{1}{2\pi} \int_{-\infty}^{\infty} \frac{1}{1+(x-3)^2} e^{-i\mu x} dx = \frac{1}{2\pi} \cdot \pi e^{-|M|} e^{-3i\mu}$ 

$$= \frac{1}{2} e^{-|M|} e^{-3i\mu}$$
by Lorentzian function.

$$= \frac{1}{2} e^{-|M|} e^{-3i\mu}$$
centered at 3.

So 
$$f(M) = \frac{\sqrt{2\pi}}{2\pi} e^{-2i\mu} - \frac{\mu^2}{2\pi} e^{-2i\mu} e^{-\frac{\mu^2}{2\pi}} = \frac{1}{\sqrt{2\pi}} e^{-2i\mu} e^{-\frac{\mu^2}{2\pi}}$$

(4) 
$$\hat{I}_{1}W = \frac{1}{2\pi} \int_{0}^{\infty} \frac{1}{e^{-2i\mu}} e^{-2i\mu} e^{-2i\mu} e^{-2i\mu} e^{-2i\mu} e^{-3i\mu}$$
